1. Introduction to Linear Regression. Linear regression is one of the most commonly used predictive modelling techniques. The aim of linear regression is to find a mathematical equation for a continuous response variable Y as a function of one or more X variable(s). So that you can use this regression model to predict the Y when only the X is ...

Linear regression is a basic and commonly used type of predictive analysis. The overall idea of regression is to examine two things: (1) does a set of predictor variables do a good job in predicting an outcome (dependent) variable? (2) Which variables in particular are significant predictors of the outcome variable, and in what way do they—indicated by the magnitude and sign of the beta ...

Linear regression can also be used to analyze the effect of pricing on consumer behaviour. For example, if a company changes the price on a certain product several times, it can record the quantity it sells for each price level and then performs a linear regression with quantity sold as the dependent variable and price as the explanatory ...

Linear regression (or linear model) is used to predict a quantitative outcome variable (y) on the basis of one or multiple predictor variables (x) (James et al. 2014, P. Bruce and Bruce (2017)). The goal is to build a mathematical formula that defines y as a function of the x variable. Once, we built a statistically significant model, it's possible to use it for predicting future outcome on ...

Introduction . All models are wrong, but some are useful – George Box. Regression analysis marks the first step in predictive modeling. No doubt, it's fairly easy to implement. Neither it's syntax nor its parameters create any kind of confusion. But, merely running just one line of code, doesn't solve the purpose. Neither just looking at R^2 or MSE values. Regression tells much more ...
